Our heritage. Our range. Our brands. Our guarantee.

Field Bins

Large Elevated Silos

Material Handling Equipment

Industrial & Rural Sheds

Commercial Projects

Chaser Bins

Flat Bottomed Silos

Transportable Silos

"Grassdale is the largest greenfield feedlot constructed in recent years and Ahrens readily accepted the challenge to build it with outstanding results."

Charlie Mort, Mort & Co

The Ahrens family established its business in South Australia's grain belt more than 100 years ago. Four generations later, the Ahrens' footprint extends from Queensland to Tasmania, providing the complete range of grain storage & handling products for Australian farmers and commercial operators.

We deliver the most complete solution for your grain storage and handling needs, using a combination of Sherwell field bins and transportable silos, Webster elevated, hopper bottom silos, Chief flat bottomed silos, and materials handling, ranging from conveyors to multi-million dollar feedmills.

Our silos incorporate innovative design features, including aeration and fumigation systems to ensure grain quality is maintained at all times. Complementary products, including grain handling equipment and stock feeders enable us to offer total solutions to our clients.

In addition to grain storage and handling products, we manufacture and supply M&S steel buildings in all sizes that can be customised to suit any application. From hay sheds and machinery sheds to large industrial warehouses and factories, M&S steel buildings are designed to meet your requirements and engineered for strength and durability.

Innovation & Product Development

At Ahrens we are committed to continuous improvement for all of our products.

Our in-house engineering team, including a dedicated Agri Engineer, focus on design improvements and innovations, including consistent upgrades to safety features, while assuring structural integrity of all products.

Safety features

All of our silos are fully ground operational to ensure the safety of users. Access hatches are fitted with safety grids to prevent anyone from falling into the silo. Warning signs are affixed to silos prior to purchase and an owner operation manual is available.

Fumigation systems

Fumigation is an important step in protecting your grain investment. At Ahrens, we are constantly working to improve the consistency and accuracy of fumigation applications to ensure your grain is kept dry, cool and free of insects. Our sealed silos use a thermosiphon pipe to create air movement and recirculate phosphine gas throughout the grain. Phosphine tablets are loaded at ground level which makes application far simpler and safer for the operator. The gas from the tablets is carried either up or down the external thermosiphon pipe. A pressure relief valve is built into this system to allow air to move in and out of the silo as internal pressure changes. Visible oil levels in the valve make it possible to do a quick pressure test annually or before fumigating with phosphine.

Aeration systems

Ahrens offers the option of aeration systems with all of its silos, including transportable, elevated and flat bottom silos. Aeration systems cool the grain, controlling insect levels and maximising grain quality.
